

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

MAX4249-MAX4257

## General Description

The MAX4249–MAX4257 low-noise, low-distortion operational amplifiers offer Rail-to-Rail® outputs and single-supply operation down to 2.4V. They draw only 400µA of quiescent supply current per amplifier while featuring ultra-low distortion (0.0002% THD), as well as low input voltage noise density (7.9nV/√Hz) and low input current noise density (0.5fA/√Hz). These features make the devices an ideal choice for portable/battery-powered applications that require low distortion and/or low noise.

For additional power conservation, the MAX4249/MAX4251/MAX4253/MAX4256 offer a low-power shutdown mode that reduces supply current to 0.5µA and puts the amplifiers' outputs into a high-impedance state. The MAX4249–MAX4257's outputs swing rail-to-rail and their input common-mode voltage range includes ground. The MAX4250–MAX4254 are unity-gain stable; the MAX4249/MAX4255/MAX4256/MAX4257 are internally compensated for gains of 10V/V or greater. The single MAX4250/MAX4255 are available in a space-saving, 5-pin SOT23 package.

## Applications

Portable/Battery-Powered Equipment  
 Medical Instrumentation  
 ADC Buffers  
 Digital Scales  
 Strain Gauges  
 Sensor Amplifiers  
 Portable Communications Devices

**Pin Configurations and Typical Operating Circuit appear at end of data sheet.**

## Features

- ◆ **Low Input Voltage Noise Density: 7.9nV/√Hz**
- ◆ **Low Input Current Noise Density: 0.5fA/√Hz**
- ◆ **Low Distortion: 0.0002% THD (1kΩ load)**
- ◆ **400µA Quiescent Supply Current per Amplifier**
- ◆ **Single-Supply Operation from +2.4V to +5.5V**
- ◆ **Input Common-Mode Voltage Range Includes Ground**
- ◆ **Outputs Swing within 8mV of Rails with a 10kΩ Load**
- ◆ **3MHz GBW Product, Unity-Gain Stable (MAX4250–MAX4254)**  
**22MHz GBW Product, Stable with  $A_V \geq 10V/V$  (MAX4249/MAX4255/MAX4256/MAX4257)**
- ◆ **Excellent DC Characteristics:**  
 **$V_{OS} = 70\mu V$**   
 **$I_{BIAS} = 1pA$**   
**Large-Signal Voltage Gain = 116dB**
- ◆ **Low-Power Shutdown Mode:**  
**Reduces Supply Current to 0.5µA**  
**Places Outputs in a High-Impedance State**
- ◆ **400pF Capacitive-Load Handling Capability**
- ◆ **Available in Space-Saving SOT23 and µMAX Packages**

## Detailed Description

The MAX4249–MAX4257 single-supply operational amplifiers feature ultra-low noise and distortion while consuming very little power. Their low distortion and low noise make them ideal for use as preamplifiers in wide dynamic-range applications, such as 16-bit analog-to-digital converters (see *Typical Operating Circuit*). Their high input impedance and low noise are also useful for signal conditioning of high-impedance sources, such as piezoelectric transducers.

These devices have true rail-to-rail output operation, drive loads as low as 1k $\Omega$  while maintaining DC accuracy, and can drive capacitive loads up to 400pF without oscillation. The input common-mode voltage range extends from V<sub>DD</sub> - 1.1V to 200mV beyond the negative rail. The push/pull output stage maintains excellent DC characteristics, while delivering up to  $\pm$ 5mA of current.

The MAX4250–MAX4254 are unity-gain stable, whereas the MAX4249/MAX4255/MAX4256/MAX4257 have a higher slew rate and are stable for gains  $\geq$ 10V/V. The MAX4249/ MAX4251/MAX4253/MAX4256 feature a low-power shutdown mode, which reduces the supply current to 0.5 $\mu$ A and disables the outputs.

## Low Distortion

Many factors can affect the noise and distortion that the device contributes to the input signal. The following guidelines offer valuable information on the impact of design choices on Total Harmonic Distortion (THD).

Choosing proper feedback and gain resistor values for a particular application can be a very important factor in reducing THD. In general, the smaller the closed-loop gain, the smaller the THD generated, especially when driving heavy resistive loads. Large-value feedback resistors can significantly improve distortion. The THD of the part normally increases at approximately 20dB per decade, as a function of frequency. Operating the device near or above the full-power bandwidth significantly degrades distortion.

Referencing the load to either supply also improves the part's distortion performance, because only one of the MOSFETs of the push/pull output stage drives the output. Referencing the load to mid-supply increases the part's distortion for a given load and feedback setting. (See the Total Harmonic Distortion vs. Frequency graph in the *Typical Operating Characteristics*.)

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

For gains  $\geq 10V/V$ , the decompensated devices (MAX4249/MAX4255/MAX4256/MAX4257) deliver the best distortion performance, since they have a higher slew rate and provide a higher amount of loop gain for a given closed-loop gain setting. Capacitive loads below 400pF do not significantly affect distortion results. Distortion performance remains relatively constant over supply voltages.

### Low Noise

The amplifier's input-referred noise voltage density is dominated by flicker noise at lower frequencies, and by thermal noise at higher frequencies. Because the thermal noise contribution is affected by the parallel combination of the feedback resistive network ( $R_F || R_G$ , Figure 1), these resistors should be reduced in cases where the system bandwidth is large and thermal noise is dominant. This noise-contribution factor decreases, however, with increasing gain settings.

For example, the input noise voltage density of the circuit with  $R_F = 100k\Omega$ ,  $R_G = 11k\Omega$  ( $A_V = 10V/V$ ) is  $e_n = 15nV/\sqrt{Hz}$ .  $e_n$  can be reduced to  $9nV/\sqrt{Hz}$  by choosing  $R_F = 10k\Omega$ ,  $R_G = 1.1k\Omega$  ( $A_V = 10V/V$ ), at the expense of greater current consumption and potentially higher distortion. For a gain of  $100V/V$  with  $R_F = 100k\Omega$ ,  $R_G = 1.1k\Omega$ , the  $e_n$  is low ( $9nV/\sqrt{Hz}$ ).

### Using a Feed-Forward Compensation Capacitor, $C_Z$

The amplifier's input capacitance is 11pF. If the resistance seen by the inverting input is large (feedback network), this can introduce a pole within the amplifier's bandwidth, resulting in reduced phase margin. Compensate the reduced phase margin by introducing a feed-forward capacitor ( $C_Z$ ) between the inverting input and the output (Figure 1). This effectively cancels the pole from the inverting input of the amplifier. Choose the value of  $C_Z$  as follows:

$$C_Z \approx 11 \times (R_F / R_G) \text{ [pF]}$$

In the unity-gain-stable MAX4250-MAX4254, the use of a proper  $C_Z$  is most important for  $A_V = +2V/V$ , and  $A_V = -1V/V$ . In the decompensated MAX4249/MAX4255/MAX4256/MAX4257,  $C_Z$  is most important for  $A_V = \pm 10V/V$ . Figures 2a and 2b show transient response both with and without  $C_Z$ .

Using a slightly smaller  $C_Z$  than suggested by the formula above achieves a higher bandwidth at the expense of reduced phase and gain margin. As a general guideline, consider using  $C_Z$  for cases where  $R_G || R_F$  is greater than  $20k\Omega$  (MAX4250-MAX4254) or greater than  $5k\Omega$  (MAX4249/MAX4255/MAX4256/MAX4257).

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

## Applications Information

The MAX4249-MAX4257 combine good driving capability with ground-sensing input and rail-to-rail output operation. With their low distortion, low noise and low power consumption, they are ideal for use in portable instrumentation systems and other low-power, noise-sensitive applications.

Figure 3. Overdriven Input Showing No Phase Reversal

Figure 4. Rail-to-Rail Output Operation

Figure 5. Capacitive-Load Driving Circuit

### Ground-Sensing and Rail-to-Rail Outputs

The common-mode input range of the MAX4249-MAX4257 extends down to ground, and offers excellent common-mode rejection. These devices are guaranteed not to undergo phase reversal when the input is overdriven (Figure 3).

Figure 4 showcases the true rail-to-rail output operation of the amplifier, configured with  $A_V = 10V/V$ . The output swings to within 8mV of the supplies with a 10k $\Omega$  load, making the devices ideal in low-supply-voltage applications.

### Output Loading and Stability

Even with their low quiescent current of 400 $\mu$ A, these amplifiers can drive 1k $\Omega$  loads while maintaining excellent DC accuracy. Stability while driving heavy capacitive loads is another key feature.

These devices maintain stability while driving loads up to 400pF. To drive higher capacitive loads, place a small isolation resistor in series between the output of the amplifier and the capacitive load (Figure 5). This resistor improves the amplifier's phase margin by isolating the capacitor from the op amp's output. Reference Figure 6 to select a resistance value that will ensure a load capacitance that limits peaking to <2dB (25%). For example, if the capacitive load is 1000pF, the corresponding isolation resistor is 150 $\Omega$ . Figure 7 shows that peaking occurs without the isolation resistor. Figure 8 shows the unity-gain bandwidth vs. capacitive load for the MAX4250-MAX4254.

### Power Supplies and Layout

The MAX4249-MAX4257 operate from a single +2.4V to +5.5V power supply or from dual supplies of  $\pm 1.20V$  to  $\pm 2.75V$ . For single-supply operation, bypass the

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

MAX4249-MAX4257

Figure 7. Peaking vs. Capacitive Load

power supply with a 0.1μF ceramic capacitor placed close to the V<sub>DD</sub> pin. If operating from dual supplies, bypass each supply to ground.

Good layout improves performance by decreasing the amount of stray capacitance and noise at the op amp's inputs and output. To decrease stray capacitance, minimize PC board trace lengths and resistor leads, and place external components close to the op amp's pins.

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

## Pin Configurations

TOP VIEW

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

Typical Operating Circuit

MAX4249-MAX4257

# SOT23, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

## Package Information

SYMBOL	MIN	MAX
A	0.90	1.45
A1	0.00	0.15
A2	0.90	1.30
b	0.35	0.50
c	0.08	0.20
D	2.80	3.00
E	2.60	3.00
E1	1.50	1.75
L	0.35	0.55
e		0.95 REF
e1		1.90 REF
α	0°	10°

NOTE:

- ALL DIMENSIONS ARE IN MILLIMETERS.
- FOOT LENGTH MEASURED AT INTERCEPT POINT BETWEEN DATUM A & LEAD SURFACE.
- PACKAGE OUTLINE EXCLUSIVE OF MOLD FLASH & METAL BURR.
- PACKAGE OUTLINE INCLUSIVE OF SOLDER PLATING.
